30cm (1')
Light, fertile soil

To Sow & Grow

Sow outdoors thinly where they are to crop, 1.5cm (½") deep directly into finely prepared soil which has already been watered. Allow 30cm (1') between rows. Early sowings may benefit from cloche protection. Seedlings usually appear in 14-21 days. Thin by harvesting young carrots evenly from the row, allowing remainder to grow on. Water well until plants are established. Regular sowings made every three weeks will ensure a continuous supply of young roots. Roots can be lifted in autumn. Remove soil and store in dry sand.

Mr. F's Tips: The short roots make it possible to grow these carrots in more stony soils and they are ideal for growing in containers.
